

5 Messages Highlighting High Susceptibility (Vulnerability)

These focus on how personally at-risk individuals are to PFAS exposure:

1. PFAS exposure isn't limited to industrial zones. It's been found in suburban and rural water supplies too.
2. Children and pregnant individuals are especially vulnerable to PFAS-related health risks.
3. PFAS can accumulate in your body over time, even from low-level exposure.
4. PFAS contamination has been found in private wells and municipal systems alike.
5. In areas with known contamination, drinking unfiltered tap water daily can increase your PFAS levels.
